

| 6 ways to use cloud technology to connect construction workers

A large proportion of construction workers do not have access to corporate IT, leaving them unconnected and often without the latest information required to carry out their work.

Here are 6 ways to connect your mobile construction workers, using innovative collaboration tools and cloud technology.

Deliver construction projects on time

Collaborating on projects in real time means you can improve performance, operational efficiencies and communication.

Adopt easy-to-use a cloud project, management and collaboration tools for both simple tasks and complex processes.

Share information with all stakeholders

Create intranets using Google Sites so all the relevant project information is available to anyone from anywhere.

Review project drawings and share all associated documents that are usually too large to send by e-mail.

Default to video not telephone calls

Hold face to face meetings with multiple people, anytime, from any location and on any device.

Carry out meetings across multiple sites to broadcast announcements, or hold debriefs with head office, whilst on site using Google Hangouts.

Efficient processes for site and data

Capture all the relevant site data using Google Forms, helping deliver projects on time. Collate the results instantly into Google Sheets and share them with all stakeholders, including site managers and project managers.

Provide technology that supports productivity

Remove the need to send large files and wait for them to download - just store them in Google Drive and share them with the relevant teams or employees. Enable employees to spend more time completing the job at hand and delighting customers.

Protect workers with up-to-date health and safety information

Make it easier for your mobile construction workers to access corporate information such as job sign off forms, site permits, safety procedures, health and safety records and updated site plans.
