

## SQL Governor®—performance management and capacity planning for Microsoft data platforms.

SQL Governor is the only software on the market to offer **both performance management and capacity planning features**. It is ideal for helping to proactively alert about problems in order to fix them. Instead of only focusing on the history and current state of the platform, the software has also unique capacity planning capabilities for on-premise and cloud migrations and consolidations in an automated and fact-based way.

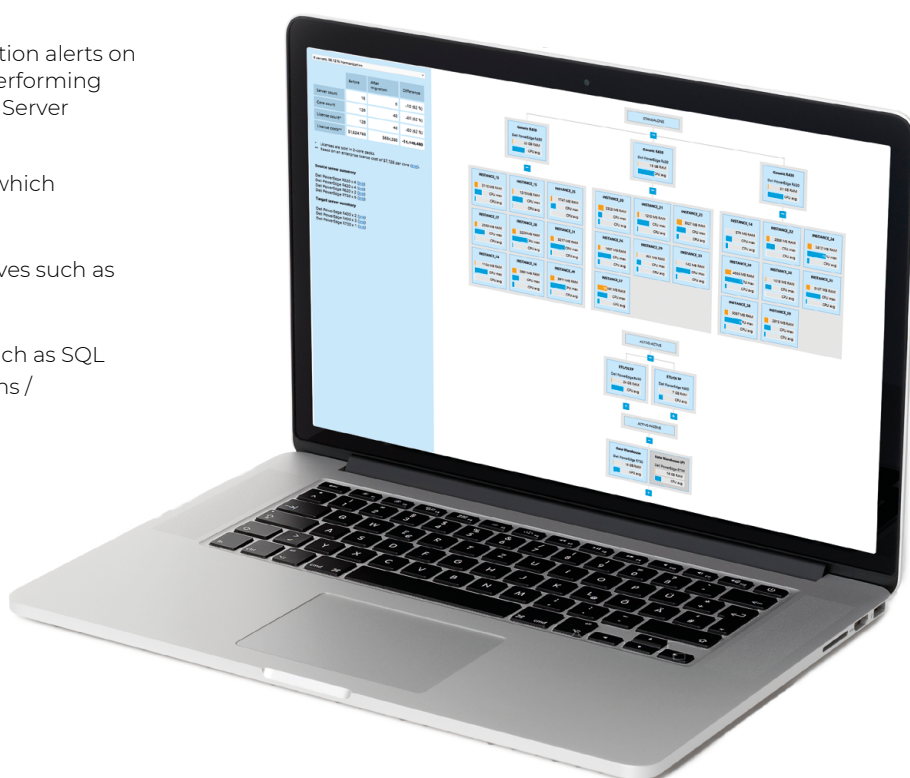

### What's new in V11

#### Monitoring

- ◆ Utilize predictive T-SQL-query anomaly detection alerts on your most critical databases to identify bad performing batches before they start to degrade the SQL Server performance
- ◆ Monitor blocking batches over time and see which statements are the root cause
- ◆ Review disk utilization from various perspectives such as per server and volume over time
- ◆ Follow calculational performance counters such as SQL compilations / batches and SQL recompilations / compilations

#### Capacity Planning

- ◆ Plan right-sizing and consolidation workloads against Azure Managed Instances and Hyperconverged Nutanix ERA compute profiles

This document highlights only the new features of the latest product release. Please refer to the separate SQL Governor product sheet for the full feature set.
