

TANKLESS HEATER INSPECTION

Important reasons to have your tankless water heater inspected each year.

CLEAN THE INLET WATER SCREENS

This screen is meant to keep particles from entering the water flow meter and damaging it. It should be cleaned periodically for maximum efficiency.

CLEAN THE AIR FILTER

Cleaning the filter will help keep dust and other grime from getting into your heater's heating system. Dust build up reduces the air flow to your heater, creating a less efficient heater.

CLEAN THE CONDENSATE TRAP

A clogged pipe can cause the drain to grow bacteria and algae. It is important to ensure the drain is open and working properly.

FLUSH WATERWAYS

By flushing a tankless hot water heater, you eliminate any and all buildup of calcium and other minerals in the unit.
