

# Unifying data to showcase quality & inform decisions.

How a longstanding construction firm uses StructionSite to showcase quality in the digital age.

At Bulley & Andrews, a Chicago-based construction firm founded in 1891, quality has long been a part of the framework of their organization. With the recent spike in adoption of technology in construction, it became clear that the data being collected needed to be organized in a way that can provide visibility into project progress, proof of quality, and inform future decision making.

“A lot of what we did was contained in another software, so we had limited access. There was very little collaboration.”

**Dana Erdman | Director of Technology and Innovation**

## Adapting to the the digitization of construction

Technology has transformed the construction process. Everyone from owners to subcontractors now expect digital documentation of projects every step of the way. For Bulley & Andrews, this meant using one primary software, supplemented by an estimated dozen others, in order to accurately capture, annotate, update and share jobsite pictures.

This disorganized tech workflow made it difficult to showcase quality of work. In some cases, project pictures were stored in folders, and in the best-case scenario, each was dated accurately so the necessary parties could manually flip through them. Whether they were using software solutions or manually tracking project progress, Bulley & Andrews employees thought the process was painful.

# Unlocking proof of quality with 360° views

Things changed for Bulley & Andrews when they adopted StructionSite. Virtually overnight, they had an easy-to-use, comprehensive solution that streamlined the documentation process of each jobsite. And, they were able to use it right away. Not only does StructionSite provide a tool to easily capture 360° walk through views of their projects, but it also helps them put that documentation to work with:

- » Streamlined communication
- » Easy image annotation
- » Progress at a glance using Split View
- » Simple sharing via public links
- » Documentation organization with tagging

And they're leveraging that functionality to not only showcase quality on all Bulley & Andrews jobsites, but also to reduce rework and create efficiencies. According to Erdman:

"There was an instance when a super and a field engineer were catching up on some drawings and noticed something 'off.' What they noticed would have meant demoing a wall to get an additional five feet of clearance they hadn't anticipated.

They went to StructionSite to review the photos and noticed there was a concrete column there, preventing the wall from being moved. It saved our team both time and money, and prevented us from opening up a wall that never needed to be opened."
