INFRASTRUCTURE MODERNISATION ADVISORY

Modernise your infrastructure to be secure and cloud-ready
Beyond Cloud.

Infrastructure modernisation is designed to help you evaluate and improve your current Azure Landing Zone infrastructure by aligning with cloud and CIS best practices. Six Degrees uses the Microsoft Cloud Adoption Framework and best practice configurations to help you meet your organisation's operational and compliance requirements while maintaining the ability to scale over time.

Six Degrees' Infrastructure Modernisation Advisory benchmarks your legacy infrastructure against your future requirements, and outlines multiple strategic and tactical options that can be implemented so that your infrastructure can be architected and migrated to the cloud in a secure manner.

Infrastructure modernisation can yield benefits for your organisation:

- Cost optimisation by provisioning the right resources to power your infrastructure.
- Increase revenue with access to a more scalable and flexible platform.
- Gain a competitive edge by adopting new technological capabilities.
- Enhance compliance by meeting data protection, security and statutory requirements.
- Improve security measures by storing valuable data and information in a central location.

The Six Degrees Infrastructure Modernisation Advisory is a workshop that will enable your organisation to:

- ✓ Get a full overview of your current infrastructure architecture.
- ✓ Discover and understand your future requirements.
- ✓ Access an advisory report, compiled by Six Degrees, with the infrastructure modernisation options available, incorporating security by design.
