

DATA LOADER

“Accelerate your Ability to get more out of your GIS now...”

Business Problem

- Complexity with migrating data from geometric network to utility network

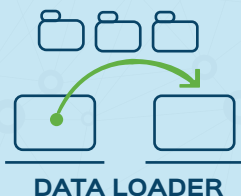

Business Solution

- Accelerate implementation of Utility Network
- Automate migration of data

Overview

Data Loader loads data from Geometric Network (GN) databases into the ArcGIS Asset Package used for implementing ArcGIS Utility Network (UN) management. This data loading is based on Microsoft Excel mapping spreadsheets. This functionality includes mapping for feature classes, fields, and domains, as well as the ability to automate operations such as unit geometry creation, terminal population, and sub network controllers. It includes GN2UN work benches to untangle the translation from one form to another, maintaining the integrity of the source data and enabling a rapid transition to usable and useful information.
