

INSPECTIONS

Increase Transparency

Insights gathered from inspections and the inputs that led to them in the first place often find their way into a series of black boxes or data silos – individuals might see what they were assigned, actions that were derived from them, or insights derived from them, but can't navigate between the different views because they usually live in different systems.

With DevonWay's Inspections solution, everyone from the inspector, to the manager, to every stakeholder in between has visibility (as allowed by the organization) into the inspection process and its outcome. That transparency helps to communicate management expectations and highlight areas for improvement that may have otherwise gone unnoticed. Additionally, through customizable inspection activity types, organizations don't have to try to fit into an inspection process that does not align with their business needs.

Summary of Benefits

- Streamline your work by allowing users to conduct inspections from a single controlled location using previously saved templates as a starting point
- Get real-time intelligence with automatic notifications and alerts that trigger at specific steps in the workflow or under specific conditions
- Enable closed-loop quality management through native integration with corrective actions, employee suggestions, and more – directly from inspection activities

Align Inspections To How You Do Business

Many times, inspections are performed based on generic industry templates that may or may not be most appropriate for your business. This forces process owners to fall back on Word, Excel, or a homegrown system, which is non-scalable and makes it hard to make data-driven decisions.

The DevonWay solution enables more operational flexibility with configurable templates that support unlimited variations of inspections. Additionally, native integration with Corrective Actions means that inspections will lead to actionable results quickly and efficiently.

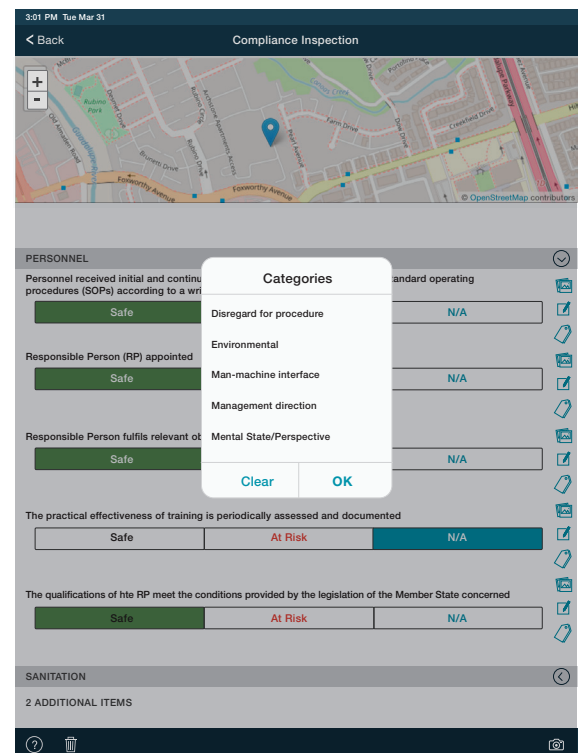

Key Features

Full Transparency

DevonWay's ad hoc reporting engine lets interested stakeholders stay automatically aware of the status of ongoing inspections, as well as search across the entire database of historical inspections using the in-memory search engine. In addition, nicely formatted emails are automatically sent when an inspection is submitted, summarizing its results to the appropriate parties.

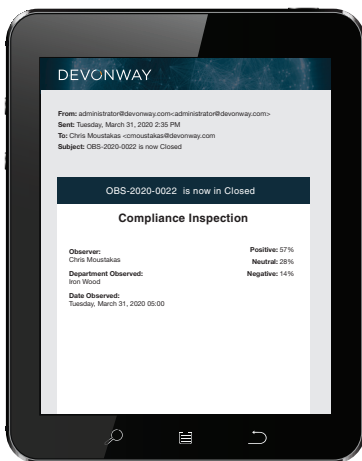

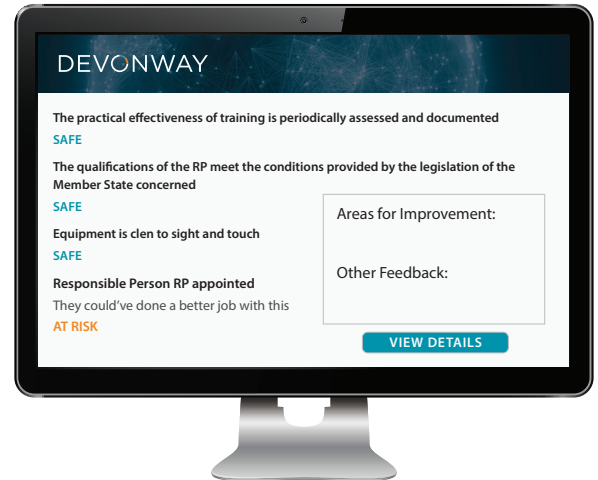

Mobile and Web Support

Inspections can be completed either in the desktop browser interface or through the native DevonWay mobile app (iOS, Android, and Windows 10). The easy-to-use mobile app supports both tablet and smartphone data entry, as well as native app features such as offline use, photo capture, speech-to-text, and geolocation.

Admin-controlled Templates

Use DevonWay Inspections to support any type of internal or external inspection activity, such as equipment inspections, inventories, drill exercises, external peer reviews, compliance checks, and more. The inspection templates are customizable by your administrators, who can control what questions the template includes, whether comments and tags should be available and/or required, whether geolocation information should be captured with the inspection, and much more – without requiring IT or DevonWay technical support.

Closed-Loop Quality Management

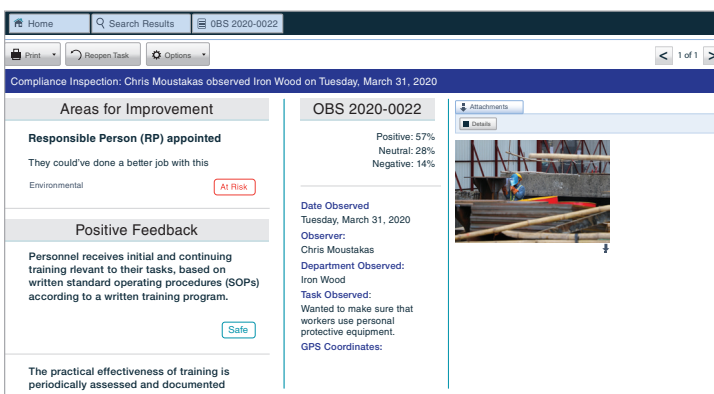

Generate corrective actions, employee suggestions, and more, directly from inspection activities. Retain the linked source and identification method for issues for superior reportability and clarity.

Line-Item-Level Photos and Comments

Users can associate tags, comments, and even photos with individual inspection line items, minimizing the level of effort later needed to map deficiencies to objective evidence that the inspector captures or records.

Long-Term Record Retention

If required, especially in regulated environments, archive-quality PDFs are automatically generated and stored in the DevonWay system or a third-party records repository for long-term retention.

With DevonWay's Inspections solution, everyone from the inspector, to the manager, to every stakeholder in between has visibility (as allowed by the organization) into the inspection process and its outcome.
